Outline

1. The Collision Model

laboratory experiments

2. Results: Application of the Model

consequences for the evolution of dust

3. New Experiments

future improvements of the model

Analog Material

spherical SiO₂ grains, \varnothing 1.5 μm, $\phi=0.15$

irregular SiO₂ grains, \varnothing 0.1-10 μm, $\phi=0.07$

Blum & Schröpler 2004
Blum, Schröpler, Davidsson
& Trigo-Rodríguez 2006

Analog Material

Random ballistic deposition (RBD) of single dust grains as an idealized representative of polydisperse growth (BPCA)

Langkowski et al., 2008

high porosity dust aggregate
and fragments of those
(\varnothing 25 mm, $\phi=0.15$)

Analog Material

Random ballistic deposition (RBD) of single dust grains as an idealized representative of polydisperse growth (BPCA)

Langkowski et al., 2008

high porosity dust aggregate
and fragments of those
(\varnothing 25 mm, $\phi=0.15$)

Intermediate porosity aggregates formed in a storage container representing a long collision history

Weidling et al., subm., Icarus

millimeter sized pebbles with
ellipsoidal shape, $\phi=0.35$

Laboratory Experiments

collision experiment

(chose aggregate mass, size ratio, porosity, collision velocity, ...)

collisional outcome

(e.g., sticking, bouncing, fragmentation, or something unexpected)

sticking

threshold velocity, new mass, new porosity, ...

bouncing

threshold velocity, new porosity, ...

fragmentation

fragment size distribution, fragment velocities, porosities, ...

Overview on Collisional Outcomes

S1 (*hit & stick*)

S2 (*sticking through surface effects*)

S3 (*sticking by penetration*)

S4 (*mass transfer*)

B1 (*bouncing with compaction*)

B2 (*bouncing with mass transfer*)

F1 (*fragmentation*)

F2 (*erosion*)

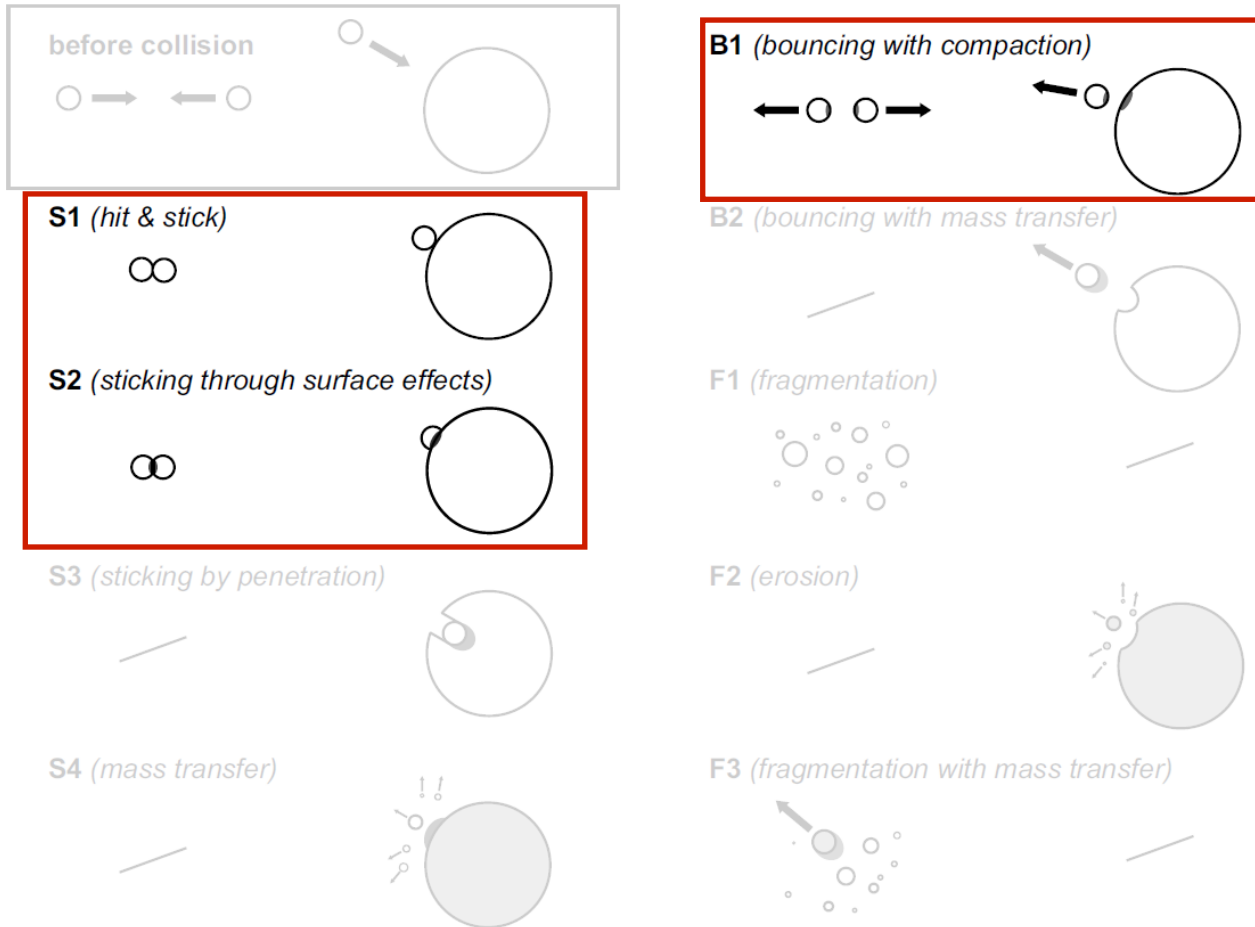

F3 (*fragmentation with mass transfer*)

Güttler et al., 2010

Overview on Collisional Outcomes

Güttler et al., 2010

S1: Hit & Stick

S1 (*hit & stick*)

Blum & Wurm,
1998

25 μm

Blum & Wurm,
2000

Blum et al.,
1998

- Sticking without any restructuring if $E_{\text{impact}} < 5 \cdot E_{\text{roll}}$
- Physical description and simulation:
Dominik & Tielens (1997)
- Experiments:
Blum & Wurm (2000)

S2: Sticking by Surface Effects

S2 (sticking through surface effects)

- Collisions can lead to sticking although the hit-and-stick threshold velocity is exceeded
- Explanation: aggregate is compacted, contact area increases
→ more contacts support sticking

size: 0.2 mm; velocity: 0.24 m/s

Kothe, Güttler & Blum,
unpublished data

B1: Bouncing with Compaction I

B1 (*bouncing with compaction*)

$v_{\text{rel}} = 0.4 \text{ m/s}$

5 mm

Heißelmann, Fraser & Blum, 2007

- Collisions between mm-sized aggregates hardly lead to sticking
- Bouncing for low velocities ($<1\text{m/s}$)

B1: Bouncing with Compaction II

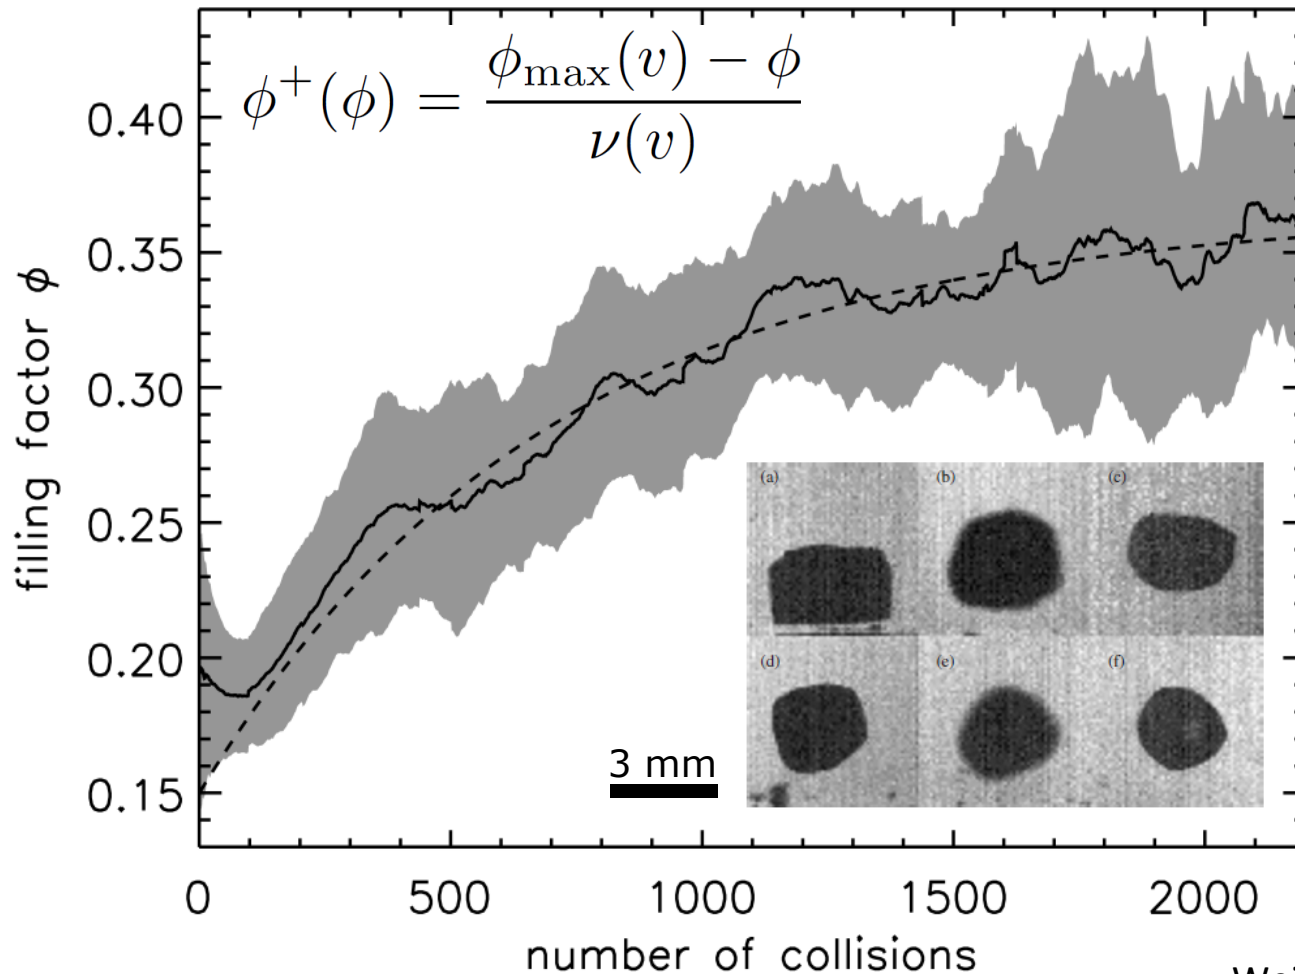

Weidling, Güttler, Blum & Brauer, 2009

$\langle v \rangle = 20 \text{ cm/s}$

4 mm

B1: Bouncing with Compaction II

Weidling et al., 2009

Overview on Collisional Outcomes

S1 (*hit & stick*)

S2 (*sticking through surface effects*)

S3 (*sticking by penetration*)

S4 (*mass transfer*)

B1 (*bouncing with compaction*)

B2 (*bouncing with mass transfer*)

F1 (*fragmentation*)

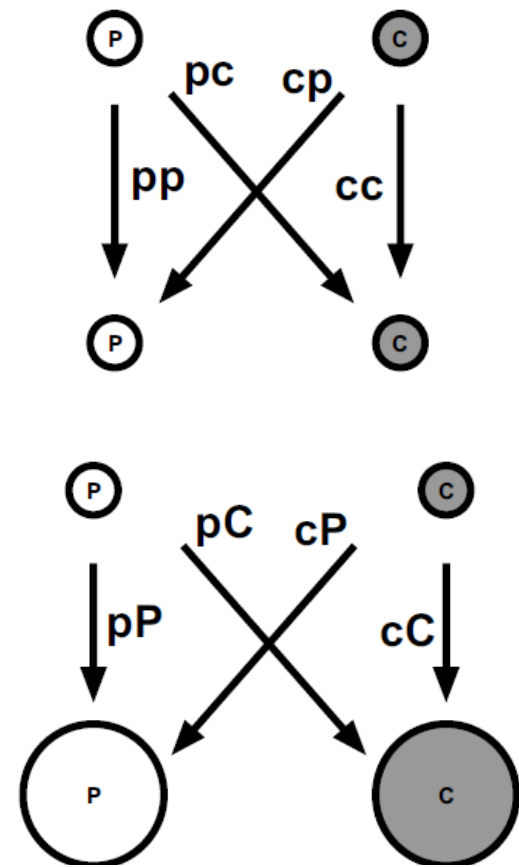

F2 (*erosion*)

F3 (*fragmentation with mass transfer*)

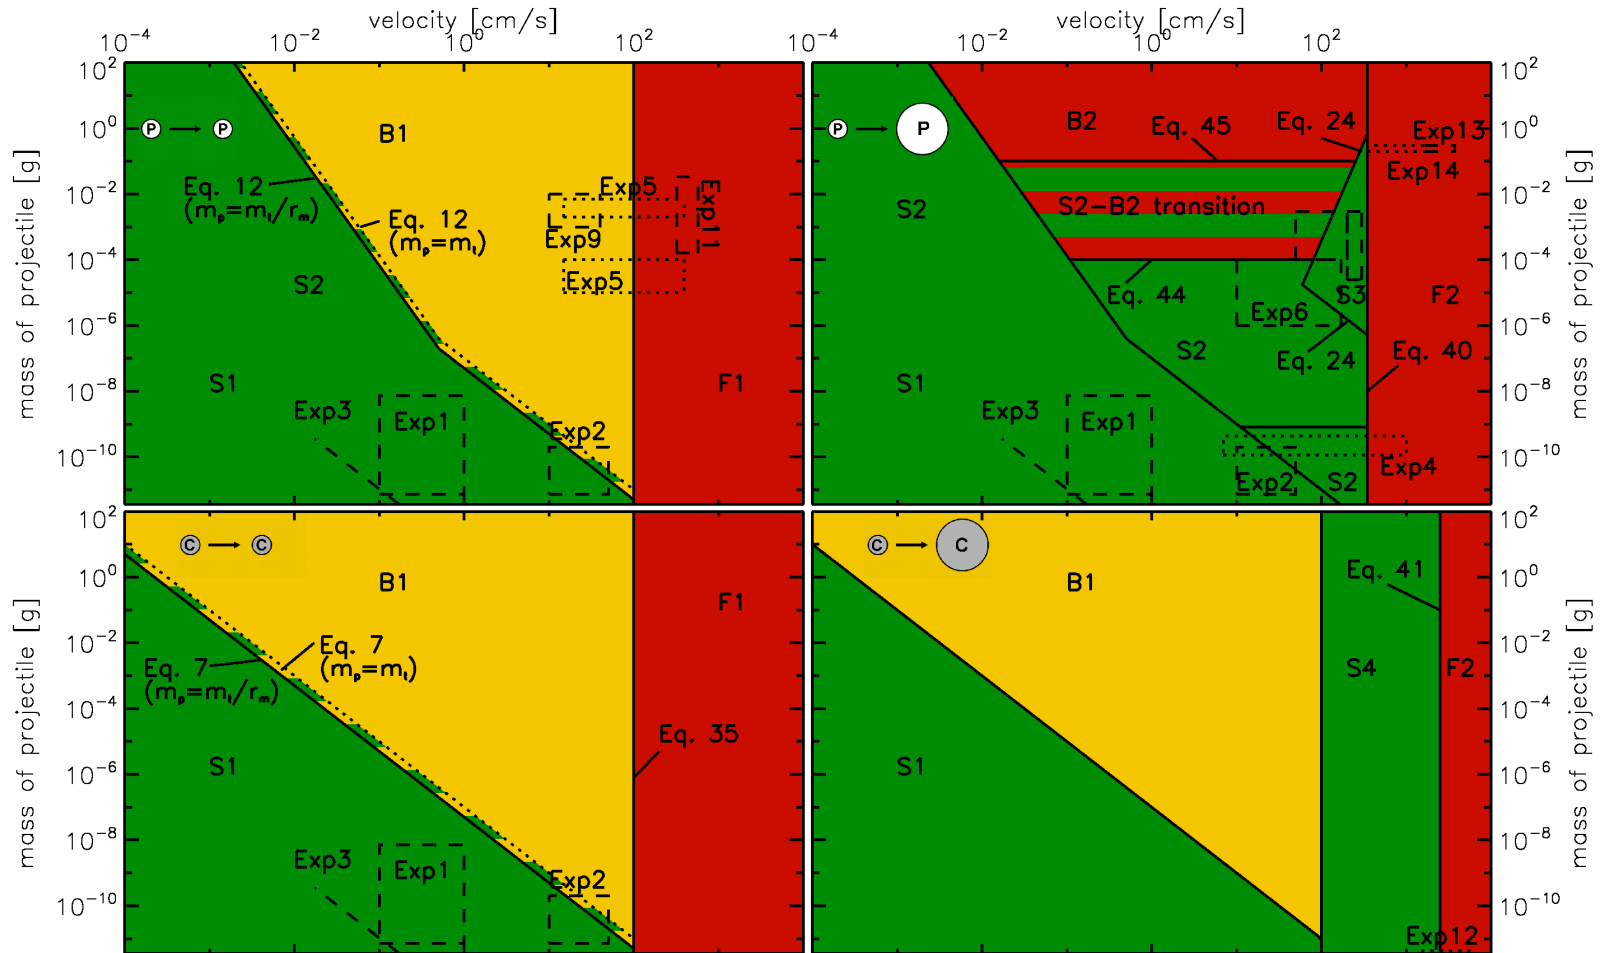

Güttler et al., 2010

x axes: velocity
 $10^{-4} \dots 10^4$ cm/s

y axes: mass
 $10^{-11} \dots 10^2$ g

The Collision Model

Outline

1. The Collision Model

laboratory experiments

2. Results: Application of the Model

consequences for the evolution of dust

3. New Experiments

future improvements of the model

The Monte-Carlo Growth Model

- Dust growth in a box in the protoplanetary disk
- Fast Monte Carlo code (Zsom & Dullemond, 2008)
- Aggregates possess physical properties (i.e. mass, porosity), which determine the collisional outcome
- Monte Carlo character: collision probabilities determine the next collision to compute
- Model parameters:
 $r=1\text{AU}$; $\alpha=10^{-4}$; $T=200\text{K}$;
 $\Sigma_0=1700\text{ g/cm}^2$ (MMSN)

How do the Aggregates Grow?

- Mass Evolution
 - max $\sim 1\text{g}$
 - Bouncing inhibits further growth
- Porosity Evolution
 - very fluffy aggregates after ~ 1000 years
 - Bouncing compacts aggregates

Zsom et al., 2010

Improvement of Monte Carlo Method

Zsom et al., 2010

Zsom et al., in press, A&A

- Collision types are much more diverse due to vertical mixing
- Fragmentation occurs, and the size distribution gets even wider
- Production of micrometer-sized grains in the disk atmosphere
- No final breakthrough through the bouncing barrier with the full, complex model

Outline

1. The Collision Model

laboratory experiments

2. Results: Application of the Model

consequences for the evolution of dust

3. New Experiments

future improvements of the model

Overview on Collisional Outcomes

S1 (hit & stick)

S2 (sticking through surface effects)

S3 (sticking by penetration)

S4 (mass transfer)

B1 (bouncing with compaction)

B2 (bouncing with mass transfer)

F1 (fragmentation)

F2 (erosion)

F3 (fragmentation with mass transfer)

Drop Tower Bremen

Collisional Outcomes

- Microgravity experiment (drop tower, suborbital flight)
- Particle diameter: 0.5-1.5 mm
- Initial velocity $\sim 0.1\text{m/s}$
- Collisional cooling down to mm/s

Weidling et al., subm., Icarus

Bouncing

Bouncing collision

$v = 62 \text{ mm/s}$

particle size:
0.5-1.5 mm

particle diameter: 1 mm
filling factor: 40%

103 analyzed collisions:

- 7x sticking
- 95x bouncing
- 1x fragmentation

Weidling et al., subm., Icarus

Sticking

Sticking collision

$v = 9 \text{ mm/s}$

particle size:
0.5-1.5 mm

particle diameter: 1 mm
filling factor: 40%

103 analyzed collisions:

- 7x sticking
- 95x bouncing
- 1x fragmentation

Weidling et al., subm., Icarus

Laboratory Drop Tower

- Laboratory drop tower
- Two aggregates collide in free fall
- Two falling cameras, 1.5 m drop height
- Velocities from 1 cm/s to 3 m/s

Beitz et al., 2011

Fragmentation Threshold

2cm diameter, 50% filling factor, velocity: 10 mm/s

2cm diameter, 50% filling factor, velocity: 1.8 m/s

Collisional Outcomes

- **bouncing** for $v < 20 \text{ cm/s}$
- **fragmentation** with mass transfer for $v > 20 \text{ cm/s}$

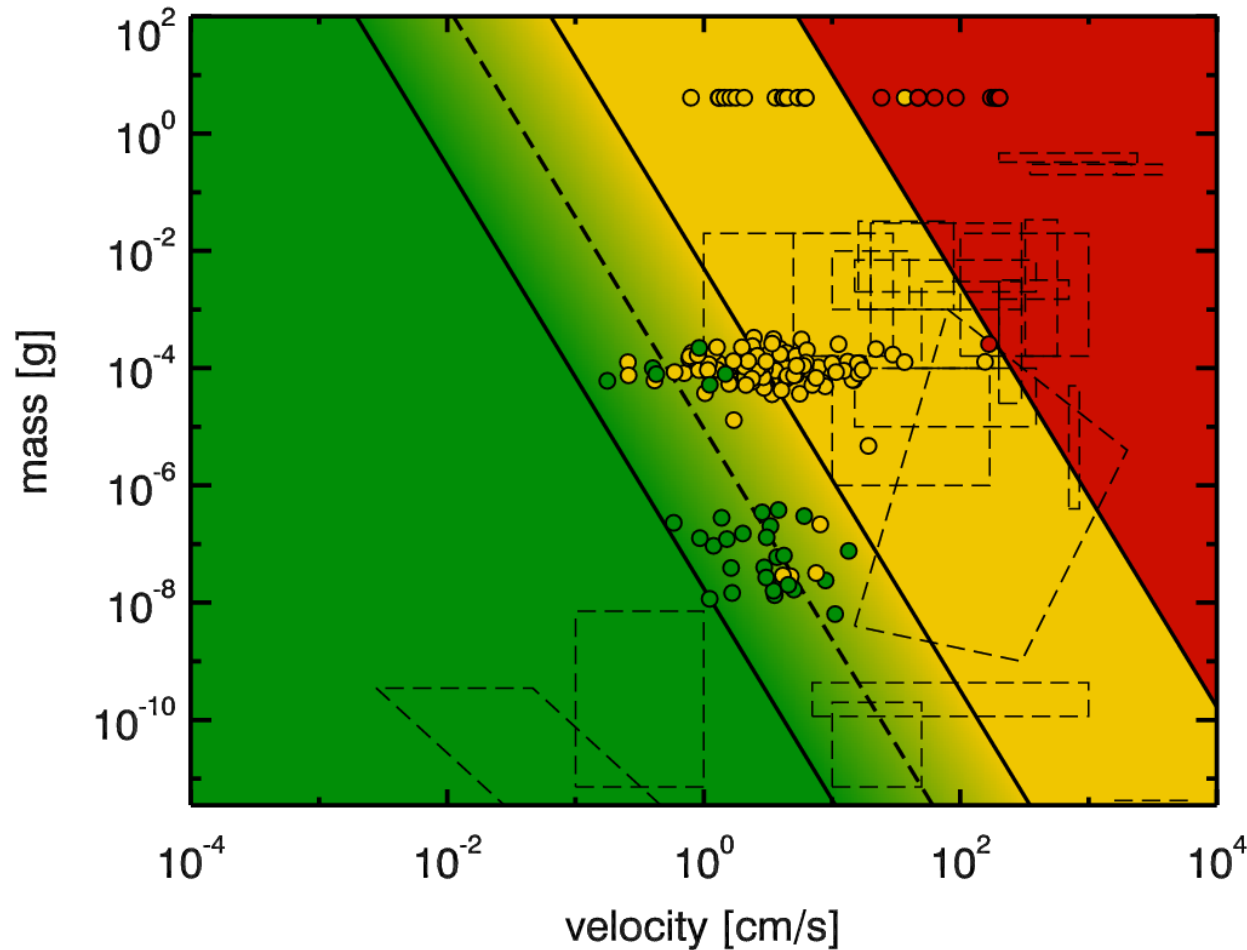

Beitz et al., 2011

Update on the Collision Model

Update on the Collision Model

Thank you for your attention!

This work was funded by the Deutsche Forschungsgemeinschaft (DFG) under grant BI 298/14-1 and by the DLR under grant 50WM0936. I am in debt to the Japanese Society for the Promotion of Science (JSPS) for funding me now.

I want to thank René Weidling, Eike Beitz, and Stefan Kothe for providing their unpublished data.

Additional information on the presented model can be found in Güttler et al. (2010, A&A) and Zsom et al. (2010, A&A).

Recent laboratory results are published by Kothe et al. (2010, ApJ), Beitz et al. (2011, ApJ), and Weidling et al. (2011, *subm.*).
