**For the Pyr-Cot transition in a super-Earth with  $10M_{\oplus}$ :**

$$\begin{aligned} \Gamma &= -10 \text{ MPa K}^{-1} \\ \frac{\Delta\rho}{\rho} &= 0.04 \\ \rho &= 8400 \text{ kg m}^{-3} \\ \alpha &= 0.53 \times 10^{-5} \text{ K}^{-1} \\ g &= 31 \text{ m s}^{-2} \\ h &= 4500 \text{ km} \end{aligned}$$

$\Rightarrow$

$$P_h \sim -0.064$$

The transition might have not so large effect even with a negative boundary.
